Extruder Principles And Operation Extruder Principles And Operation:

Extruder Principles and Operation M.J. Stevens, Jose Covas, 1995-10-31 This book is intended to fill a gap between the theoretical studies and the practical experience of the processor in the extrusion of thermoplastic polymers. The former have provided a basis for numerical design of extruders and their components but generally give scant attention to the practical performance especially to the conflict between production rate and product quality. In practice extruders are frequently purchased to perform a range of duties even so the operator may have to use a machine designed for another purpose and not necessarily suitable for the polymer process or product in hand. The operator's experience enables him to make good product in unpromising circumstances but a large number of variables and interactions often give apparently contradictory results. The hope is that this book will provide a logical background based on both theory and experience which will help the industrial processor to obtain the best performance from his equipment to recognize its limitations and to face new problems with confidence. Mathematics is used only to the extent that it clarifies effects which cannot easily be expressed in words. If it is passed over at least a qualitative understanding should remain. The approximate theory will not satisfy the purist but this seems to the authors less important than a clear representation of the physical mechanisms on which so much of the polymer processing industry depends. Hydrostatic Extrusion N. Inoue, M. Nishihara, 1985-08-31 This book is intended to be a reference text on hydrostatic extrusion a multidisciplinary technology involving the forming process of materials tribology high pressure engineering and so forth. Until now only one book bearing the title of hydrostatic extrusion by Prof Alexander and Dr Lengyel has been published since 1971. Although there are chapters on hydrostatic extrusion in such books as THE MECHANICAL BEHAVIOUR OF MATERIALS UNDER PRESSURE edited by Dr Pugh METAL FORMING by Prof Avitzur and HIGH PRESSURE TECHNOLOGY by Drs Spain and Paauwe it is regrettable that no up to date reference books on hydro static extrusion are available. As is well known hydrostatic extrusion is a nearly ideal lubricated extrusion. Its advantages have been demonstrated by laboratory research in the past two decades yet many manufacturers however still hesitate to adopt the technology in their plants. Their hesitation is certainly due to the lack of exact information on the process and its equipment and also to their unfamiliarity with the actual method of operation. In order to provide a useful introduction to the subject for engineers who work in industries which plan to employ this technique and also to give exact and reliable information on the durability and performance of production facilities as well as the capabilities of the process and the properties of extruded products we decided to publish this book. Starting with theories

The increasing use of synthetic polymers in preference to metals and other engineering materials for a wide range of applications has been accompanied by the development and improvement of processes for converting them into useful products. Indeed it is often the comparative ease and cheapness with which polymeric materials can be processed that make them attractive choices. Because of the relatively complex behaviour of the materials, polymer processes may appear to be difficult to understand and analyze quantitatively. The purposes of this book are to introduce the reader briefly to the main methods of processing thermoplastic polymers and to examine the principles of flow and heat transfer in some of the more industrially important of these processes. Much attention is devoted to the two most widely used methods, screw extrusion and injection moulding. Quantitative analyses based on mathematical models of the processes are developed in order to aid the understanding of them and to improve both the performance and design of processing equipment. In addition to algebraic formulae, some worked examples are included to illustrate the use of the results obtained. In cases where analytical solutions are not possible, methods of numerical solution using digital computers are discussed in some detail and typical results presented.
