

## 14-6 The Doppler Effect

The Doppler effect is the change in pitch of a sound when the source and observer are moving with respect to each other.

When an observer moves toward a source, the wave speed appears to be higher, and the frequency appears to be higher as well.

**The Micro-doppler Effect in Radar** Victor C. Chen, 2011 The Doppler Effect can be thought of as the change in frequency of a wave for an observer moving relative to the source of the wave In radar it is used to measure the velocity of detected objects This highly practical resource provides thorough working knowledge of the micro Doppler effect in radar including its principles applications and implementation with MATLAB codes The book presents code for simulating radar backscattering from targets with various motions generating micro Doppler signatures and analyzing the characteristics of targets In this title professionals will find detailed descriptions of the physics and mathematics of the Doppler and micro Doppler effect The book provides a wide range of clear examples including an oscillating pendulum a spinning and precession heavy top rotating rotor blades of a helicopter rotating wind turbine blades a person walking with swinging arms and legs a flying bird and movements of quadruped animals

**Using Physics Gadgets and Gizmos, Grades 9-12** Matthew Bobrowsky, Mikko Korhonen, Jukka Kohtamäki, 2014-03-01 What student or teacher can resist the chance to experiment with Rocket Launchers Drinking Birds Dropper Poppers Boomwhackers Flying Pigs and more The 54 experiments in Using Physics Gadgets and Gizmos Grades 9-12 encourage your high school students to explore a variety of phenomena involved with pressure and force thermodynamics energy light and color resonance buoyancy two dimensional motion angular momentum magnetism and electromagnetic induction The authors say there are three good reasons to buy this book

- 1 To improve your students thinking skills and problem solving abilities
- 2 To acquire easy to perform experiments that engage students in the topic
- 3 To make your physics lessons waaaaay more cool

The phenomenon based learning PBL approach used by the authors two Finnish teachers and a U S professor is as educational as the experiments are attention grabbing Instead of putting the theory before the application PBL encourages students to first experience how the gadgets work and then grow curious enough to find out why Students engage in the activities not as a task to be completed but as

exploration and discovery The idea is to help your students go beyond simply memorizing physics facts Using Physics Gadgets and Gizmos can help them learn broader concepts useful critical thinking skills and science and engineering practices as defined by the Next Generation Science Standards And thanks to those Boomwhackers and Flying Pigs both your students and you will have some serious fun For more information about hands on materials for Using Physical Science Gadgets and Gizmos books visit Arbor Scientific at <http://www.arborsci.com> nsta hs kits

**New Doppler Effect** Florian Ion Petrescu, 2012-01-01 The Doppler effect or Doppler shift named after Austrian physicist Christian Doppler who proposed it in 1842 in Prague is the change in frequency of a wave for an observer moving relative to the source of the wave It is commonly heard when a vehicle sounding a siren or horn approaches passes and recedes from an observer The received frequency is higher compared to the emitted frequency during the approach it is identical at the instant of passing by and it is lower during the recession The relative changes in frequency can be explained as follows When the source of the waves is moving toward the observer each successive wave crest is emitted from a position closer to the observer than the previous wave Therefore each wave takes slightly less time to reach the observer than the previous wave Therefore the time between the arrival of successive wave crests at the observer is reduced causing an increase in the frequency While they are travelling the distance between successive wave fronts is reduced so the waves bunch together Conversely if the source of waves is moving away from the observer each wave is emitted from a position farther from the observer than the previous wave so the arrival time between successive waves is increased reducing the frequency The distance between successive wave fronts is increased so the waves spread out For waves that propagate in a medium such as sound waves the velocity of the observer and of the source is relative to the medium in which the waves are transmitted The total Doppler Effect may therefore result from motion of the source motion of the observer or motion of the medium Each of these effects is analyzed separately For waves which do not require a medium such as light or gravity in general relativity only the relative difference in velocity between the observer and the source needs to be considered The Doppler Effect 1 3 represents the frequency variation of the waves received by an observer which is drawing coming respectively it's removing going from a wave spring source If a bright spring is drawing to an observer the frequency of waves received by the observer is bigger than the emitted frequency of source such that the respective spectral lines are moving to violet On the contrary if

the light source is removing from the observer the spectral lines are moving to red One proposes to study the Doppler Effect for the light waves generally for the electromagnetic waves

**ON THE DOPPLER EFFECT IN A MEDIUM.** Kelvik S. H. Lee,CALIFORNIA INST OF TECH PASADENA ANTENNA LAB.,California Institute of Technology. Division of Engineering and Applied Science,1963 The problem of calculating the frequency of the wave scattered by a body moving in a medium is formulated from field theoretic considerations The Doppler equation for a homogeneous dispersive medium is obtained on the basis of the fact that the frequency and the wave vector of a plane wave form a 4 vector It is found that the solutions of the Doppler equation can be classified into two kinds In one the solutions are close to the frequency of the incident wave In the other kind they appear near the poles of the refractive index of the medium on the  $\omega$  axis In the case of an isotropic plasma the monochromaticity of the incident wave is shown to be preserved after the wave is scattered by a moving body However in the case of a magneto active plasma the scattered wave contains more than one frequency for a monochromatic incident wave The physical interpretations of these frequencies are given In an inhomogeneous medium the Doppler equation has to be derived from a different starting point The crucial point of the derivation is to perform spectral decompositions of the transformed fields and then to apply under the assumption of gradual inhomogeneity the method of stationary phase to determine the critical points Author
