Abstract

This paper discusses the feasibility of AE technique for monitoring of fatigue damage of high strength bearing steel. We studied AE source mechanism in fatigue process using the waveform and source simulation analyses. The steel specimens, subjected to four-point cyclic bending, produced a few but strong AE signals just before the final fracture. Fractographic study showed a change of fracture type from transgranular (TG) to intergranular (IG). Crack volume was estimated by source simulation of AE as approximately 10^{-15} m^3 . Another fatigue fracture test of a compact tension (CT) specimen also showed a change of fracture type from TG- to IG-fracture at around $K_{\max}$ of 8 MPa $\sqrt{\text{m}}$, above which both the fast crack propagation and high AE generation rates were detected. The source simulation analysis indicated simultaneous IG fracture of neighboring few grains as the source of AE for fatigue test of the CT specimen.

Introduction

A consideration of ultra-high-cycle fatigue of more than 10^7 cycles is becoming important for maintenance of infrastructure [1]. This type of fatigue is called as giga-cycle fatigue, producing fatigue failure at stress lower than the fatigue limit determined by the conventional fatigue test up to 10^7 cycles. High-strength steels have been reported to exhibit a distinct knee point within a cycle range of $N = 10^5$ - 10^6 and the curve has another knee point in the long-life region of $N > 10^7$ [2, 3]. This “duplex S - N curve”, consisting of two different curves, is observed for long-term cyclic loading, and suggests that the endurance limit by the conventional fatigue concept cannot provide the safety design data for mechanical structures. Many researchers [4] have studied the fracture mechanisms in high-cycle range. Although the monitoring technique of fatigue crack is urgent in infrastructure, it has not been performed well so far. Development of the monitoring method is also an important issue.

We studied feasibility of acoustic emission (AE) as a method of fatigue damage monitoring of a bearing steel (SUI2). Both the smooth rectangular bend specimens and compact tension (1/2 CT) specimens were used for studying fatigue crack initiation and propagation. The mechanism of fatigue damage was also investigated by waveform and source simulation analyses of AE signals.

Test Specimen and Experimental Procedures

The specimen used is a high-carbon chromium bearing steel (JIS G4805), which is commonly used for bearing components. The steel grade is designated as SUI2. Chemical composition and mechanical properties of the specimen were shown in Tables 1 and 2, respectively.

Dynamics Of Fracture Dynamics Of Fracture:

Dynamics of Fracture N. Morozov, Y. Petrov, 2013-06-05 In this book a new phenomenological approach to brittle medium fracture initiation under shock pulses is developed. It provides an opportunity to estimate fracture of media with and without macrodefects. A qualitative explanation is thus obtained for a number of principally important effects of high speed dynamic fracture that cannot be clarified within the framework of previous approaches. It is possible to apply this new strategy to resolve applied problems of disintegration, erosion and dynamic strength determination of structural materials. Specialists can use the methods described to determine critical characteristics of dynamic strength and optimal effective fracture conditions for rigid bodies. This book can also be used as a special educational course on deformation of materials and constructions and fracture mechanics.

Dynamic Fracture K. Ravi-Chandar, 2004-10-16 Dynamic fracture in solids has attracted much attention for over a century from engineers as well as physicists due both to its technological interest and to inherent scientific curiosity. Rapidly applied loads are encountered in a number of technical applications. In some cases such loads might be applied deliberately as for example in problems of blasting, mining and comminution or fragmentation; in other cases such dynamic loads might arise from accidental conditions. Regardless of the origin of the rapid loading it is necessary to understand the mechanisms and mechanics of fracture under dynamic loading conditions in order to design suitable procedures for assessing the susceptibility to fracture. Quite apart from its repercussions in the area of structural integrity, fundamental scientific curiosity has continued to play a large role in engendering interest in dynamic fracture problems. In depth coverage of the mechanics, experimental methods, practical applications, Summary of material response of different materials, Discussion of unresolved issues in dynamic fracture.

Dynamic Fracture Mechanics L. B. Freund, 1998-03-28 This volume focuses on the development and analysis of mathematical models of fracture phenomena.
