Dynamical Systems An Introduction With Applications In Economics And Biology:

Dynamical Systems Pierre N.V. Tu, 2012-12-06 The favourable reception of the first edition and the encouragement received from many readers have prompted the author to bring out this new edition This provides the opportunity for correcting a number of errors typographical and others contained in the first edition and making further improvements This second edition has a new chapter on simplifying Dynamical Systems covering Poincare map Floquet theory Centre Manifold Theorems normal forms of dynamical systems elimination of passive coordinates and Liapunov Schmidt reduction theory It would provide a gradual transition to the study of Bifurcation Chaos and Catastrophe in Chapter 10 Apart from this most others in fact all except the first three and last chapters have been revised and enlarged to bring in some new materials elaborate some others especially those sections which many readers felt were rather too concise in the first edition by providing more explanation examples and applications Chapter 11 provides some good examples of this Another example may be found in Chapter 4 where the review of Linear Algebra has been enlarged to incorporate further materials needed in this edition for example the last section on idempotent matrices and projection would prove very useful to follow Liapunov Schmidt reduction theory presented in Chapter 9

This book presents a wide and comprehensive range of issues and problems in various fields of science and engineering from both theoretical and applied perspectives. The desire to develop more effective and efficient tools and techniques for dealing with complex processes and systems has been a natural inspiration for the emergence of numerous fields of science and technology in particular control and automation and more recently robotics. The contributions gathered here concern the development of methods and algorithms to determine best practices regarding broadly perceived decisions or controls. From an engineering standpoint many of them focus on how to automate a specific process or complex system. From a tools based perspective several contributions address the development of analytic and algorithmic methods and techniques, devices and systems that make it possible to develop and subsequently implement the automation and robotization of crucial areas of human activity. All topics discussed are illustrated with sample applications.
